# COOP'S CORNER

## Release and budget revision | October 15, 2026

### *corner-api-budget-plan.pdf*

This revision implements the owner request to withdraw BetOnline and control local service startup manually. This page supersedes conflicting book counts, source requirements and local startup instructions in the retained plan that follows. Document content is planning evidence, not authorization to deploy, purchase or run services.

## Current platform scope

BetOnline is excluded from new odds requests, main-line and player-prop feeds, betting targets, reference pricing, sportsbook filters and outbound links. Older captures and configuration overrides cannot restore it to these feeds. Historical research and personal wager records are retained for audit purposes. Do not substitute another source without reviewing its eligibility.

| Request group | Current count | Budget consequence |
|---|---|---|
| Main: standard / exchange | 6 / 6 (12 total) | Each split group remains at most 10 |
| Props: standard / exchange | 8 / 6 (14 total) | Combined request still uses 2 groups |
| Main: combined request | 12 books | Up to 6 credits for 3 returned markets |
| Props: combined request | 14 books | Up to 2 credits / returned market / event |

Remaining main sources: DraftKings, FanDuel, theScore Bet (provider key espnbet), BetMGM, Novig, BetRivers, Pinnacle, Betfair Exchange UK, ProphetX, Kalshi, BetOpenly and Polymarket. Props additionally request PrizePicks and Underdog.

## Budget effect

Removing one book does not cross a ten-book billing boundary. Keep the existing subscription and spending caps as planning assumptions; do not book a subscription saving. At 18 billable sport keys, 3 markets and a 16-hour daily window, (960 + 2,880) x 3 x 18 x 30 = **6,220,800 main credits**; 31 days = **6,428,160**. A separately modeled 24-hour plan remains 9,331,200 / 9,642,240 main credits for 30 / 31 days. These are alternative operating scenarios, not additive allocations. Actual returned markets, expanded tennis keys and quota headers control usage.

The prior $249 / 15M assumption, hosting quotes, member pricing, revenue, cash runway and props scenarios receive no automatic financial adjustment from this removal. Prices and hosting availability were not reverified in this revision. For beta scheduling, the latest supplied Bluehost Revision 7 uses 8 a.m.-midnight America/Chicago; the earlier noon-4 a.m. window and Oracle hosting proposal remain historical alternatives.

# Manual operation and release checks

## Local service control

From the repository folder, double-click **Start-Corner.cmd** to start the refresh service, tools API and web app. After startup, open **http://localhost:3000**. Double-click **Stop-Corner.cmd** to stop the app processes and optional ngrok tunnel. PowerShell equivalents: scripts/start-services.ps1 and scripts/stop-services.ps1. The launchers do not register boot or login startup. They start no tunnel unless the operator explicitly supplies -Ngrok.

The refresh service starts first to establish the login secret, then the tools API, then the web app. Starting services does not itself start a paid collection schedule. In the current checkout, odds refresh remains user-triggered. The cloud cadence, shared scheduler, credit governor, production supervision, payments and invitation controls described in the older plans remain implementation work unless separately verified. Manual local startup does not revoke the separately proposed production budget or cadence.

## Acceptance for this revision

- No BetOnline option or opportunity appears in main-line or props feeds, including old retained captures and environment overrides.

- Main requests name 12 books; props requests name 14. Missing BetOnline is never filled with synthetic prices or an unapproved fallback.

- Remaining reference weights are renormalized over eligible sources; minimum-reference and exact-contract rules still apply.

- The operator can start and stop local services explicitly. Launch readiness still requires a separate production build, deployment and end-to-end verification.

- No cost saving, cloud deployment, payment readiness or scheduled collection is claimed merely because these PDFs were revised.

## Reading the retained plan

The original layout and unaffected financial/product chapters follow. Inline source names and directly matching book-count statements have been revised where possible. The revision banner marks every retained page. Where a legacy table or roadmap assumes 13 main books, 15 props books, seven standard main books or nine standard props books, use **12 / 14 / 6 / 8** respectively. An earlier requirement that BetOnline be a mandatory reference is retired; it is not a current launch dependency. All unimplemented roadmap items stay unimplemented. Original source files remain unchanged outside the workspace.

COOP'S CORNER

# API budget plan

**$249/month | 15 million credits | 25 users**

Shared main-odds polling for 16 hours daily, with manually requested player props.

## 1. Monthly spending envelope

| Allocation | Credit allowance | Purpose |
|---|---|---|
| Main odds | 6.5M | Regular sportsbooks at 60 seconds; exchanges at 20 seconds. |
| Player props | 7.0M | Shared manual fetch budget, with caching and request deduplication. |
| Reserved headroom | 1.5M | Extra tournament keys, retries and demand variation; controlled release only. |
| Total | 15.0M | $249 subscription using the prices supplied. $9.96 per user at 25 users. |

## 2. Main-odds refresh schedule

| Book group | Books | Interval | Monthly credits |
|---|---|---|---|
| Regular sportsbooks | 6 | 60 seconds | 1,555,200 |
| Exchanges | 6 | 20 seconds | 4,665,600 |
| Combined | 12 | 16 hours/day | 6,220,800 |

Calculation: 18 billable league/tournament keys x 3 markets x (960 sportsbook cycles + 2,880 exchange cycles/day) x 30 days. Each group has fewer than 11 books and costs up to 3 credits per league request.

## 3. Assumptions and limits

All users share the same odds captures. User count does not multiply main-odds polling. The estimate assumes 18 billable provider keys; tennis picker entries can expand into multiple tournament keys. Each modeled main request returns all three markets.

In a 31-day period, the same main schedule uses **6,428,160 credits**, within the 6.5M allocation. Inactive leagues and empty responses can reduce usage. More provider keys can increase it.

The 16-hour operating window must be explicitly configured in America/Chicago. Outside it, no scheduled main-odds polling is budgeted. Manual props requests at any hour use the same props allowance.

**Proposed, not deployed:** this document specifies the scheduler and budget controls to implement. Existing reference weights, filters and sportsbook links do not add paid API requests. Hosting and database costs are excluded.

# Player props and budget controls

Budget credits, not clicks. Larger fetches can cost over 16 times more than a default NBA fetch.

## 4. Cost of one uncached props fetch

| Selection | Credit calculation | Maximum cost |
|---|---|---|
| Default NBA | 8 games x 3 markets x 2 | 48 credits |
| All supported NBA markets | 20 games x 16 markets x 2 | 640 credits |
| Largest current football selection | 20 games x 20 markets x 2 | 800 credits |

Props requests name 14 books, which count as two bookmaker billing groups. Actual cost depends on returned markets and available games. Cached requests incur no additional provider charge.

## 5. Heavy-use scenarios: 25 users

| Fetches per user/day | Default NBA total/month | Largest football total/month |
|---|---|---|
| 10 | 6.58M / $249 | 12.22M / $249 |
| 25 | 7.12M / $249 | 21.22M / $350 |
| 50 | 8.02M / $249 | 36.22M / $650 |
| 100 | 9.82M / $249 | 66.22M / $950 |
| 200 | 13.42M / $249 | 126.22M / beyond listed plans |

Totals include the 6.2208M main-odds baseline and assume 30 days, all 25 users making every modeled fetch, and no cache savings. Prices are the smallest supplied plan fitting that consumption. These are scenarios, not approved spending limits.

The **7M props allocation** supports about **194 default NBA fetches** or **11 maximum-sized football fetches per user/day** over 30 days. In 31 days, the corresponding averages are about 188 and 11. These are consumption equivalents, not enforced per-user click quotas.

## 6. Required implementation controls

**Shared scheduler:** one database-backed owner per league/book group; merge group captures without deleting the other group. Stagger jobs and back off on provider failures.

**Shared props cache:** deduplicate simultaneous requests; reuse recent game/market captures; fetch only missing or expired selections. Show users when cached data was used.

**Credit governor:** reserve worst-case credits before dispatch, reconcile actual response charges, and track all requests against the provider reset period. At the props allocation limit, serve cached data and defer paid fetches; release reserved headroom only through policy.

**Monitoring:** track actual credits, projected reset-period consumption, cache-hit rate, source age, failures and unchanged responses. Slow background polling before the total allowance is threatened. Recalculate limits from actual reset dates and remaining credits.

Sources: subscription prices supplied by the user; current app request settings. Provider references: credit rules and published update intervals. The provider lists approximately 60-second pre-match sportsbook/props updates and 20-second exchange updates; faster polling does not guarantee new prices.
